# The $A^{2} \Pi_{i}-X^{2} \Sigma^{+}$System of CP: Observation of New Bands 

R. S. Ram, S. Tam, and P. F. Bernath ${ }^{1,2}$<br>Department of Chemistry, University of Arizona, Tucson, Arizona 85721

#### Abstract

Infrared emission spectra of the $A^{2} \Pi_{i}-X^{2} \Sigma^{+}$system of CP have been observed at high resolution using a Fourier transform infrared spectrometer. The rotational structure of seven new bands involving vibrational levels up to $v=4$ of both electronic states has been analyzed and equilibrium molecular constants have been determined. For the $X^{2} \Sigma^{+}$state $\omega_{\mathrm{e}}=1239.77924(8) \mathrm{cm}^{-1}$ and $r_{\mathrm{e}}$ $=1.5619780(2) \AA$ were derived, while for the $A^{2} \Pi_{i}$ state the corresponding values are $\omega_{e}=$ $1062.47140(98) \mathrm{cm}^{-1}$ and $r_{\mathrm{e}}=1.654420(6) \AA$. © 1992 Academic Press, Inc.

## INTRODUCTION

CP is a free radical isovalent with CN and SiN . This radical was first observed by Herzberg (1) who observed the $B^{2} \Sigma^{+}-X^{2} \Sigma^{+}$transition which is analogous to the violet system of CN . The rotational structure of this system was analyzed by Baerwald et al. (2), who also observed the $B^{2} \Sigma^{+}-A^{2} \Pi$ transition. The rotational structure of the $B^{2} \Sigma^{+}-A^{2} \Pi$ system was also investigated by Chaudhry and Upadhya (3) and later by Tripathi et al. (4).

More recently we reported the first observation of the $A^{2} \Pi_{i}-X^{2} \Sigma^{+}$transition of CP (5) (analogous to the red system of CN ). In this study the rotational analysis of five vibrational bands was carried out. This work was followed by the detection of the pure rotational spectrum in the ground electronic state of CP by Saito and co-workers (6). These microwave measurements resolved the hyperfine structure due to the $P$ nucleus ( $I=\frac{1}{2}$ ). Calculations of Franck-Condon factors, $r$-centroids, and the potential energy curves of CP have been published by several workers (7-10).

CP is an excellent candidate for detection in circumstellar envelopes of stars (such as IRC +10216 ) and in the interstellar medium. IRC +10216 is a prototypical cool carbon star surrounded by a thick shell of dust and molecules. Linear carbon chain molecules such as $\mathrm{C}_{n}(11,12), \mathrm{C}_{n} \mathrm{H}(13), \mathrm{C}_{n} \mathrm{~N}(14), \mathrm{C}_{n} \mathrm{O}(15), \mathrm{C}_{n} \mathrm{~S}(16,17)$, and $\mathrm{HC}_{n} \mathrm{~N}(18,19)$ have been found in IRC +10216 and various other extraterrestrial sources, suggesting that the analogous phosphorous families $\mathrm{C}_{n} \mathrm{P}$ and $\mathrm{HC}_{n} \mathrm{P}$ might be found. CP is the first member of the $\mathrm{C}_{n} \mathrm{P}$ family.

There is a surprisingly strong bond in the CP molecule with a large dissociation energy of $121 \mathrm{kcal} /$ mole (20-22). This large dissociation energy also makes the detection of CP quite favorable in space. These speculations have recently been confirmed by the observation of CP in the carbon star IRC +10216 (23). Other recent work on CP includes the detection of the ESR spectrum in an argon matrix and two ab initio calculations of molecular properties $(24,25)$.

In the present study we extend our previous work on the $A^{2} \Pi_{i}-X^{2} \Sigma^{+}$transition of CP to include bands involving $v=0-4$ of both states. We have rotationally analyzed

seven new bands, $2-2,3-3,3-1,1-3,2-0,4-3$, and $2-4$. The molecular constants obtained in this study, combined with our previous data, provide improved equilibrium constants for both electronic states. These constants were used in the calculation of potential energy curves for the $A^{2} \Pi$ and $X^{2} \Sigma^{+}$states and the Franck-Condon factors for the $A-X$ system.

## EXPERIMENTAL DETAILS

The emission spectra of $C P$ were observed in two separate experiments. In the first spectrum (used in the previous analysis) CP bands were observed in a microwave discharge of a mixture of 0.04 Torr of white phosphorous vapor and 0.4 Torr of $\mathrm{H}_{2}$ in a quartz cell. This cell was previously used in experiments with methane so the

carbon atoms required for the formation of CP were deposited on the walls of the discharge cell. This experiment was originally designed to produce the vibrationrotation bands of PH (26). In the second spectrum (used in this analysis) a mixture of 0.04 Torr of white phosphorous vapor, 2.75 Torr of He , and 0.03 Torr of $\mathrm{CH}_{4}$ was used in the same discharge tube. The spectra obtained in these experiments were extremely rich with strong spectra of $\mathrm{CP}(5), \mathrm{CH}(27,28), \mathrm{PH}(26), \mathrm{P}_{2}, \mathrm{CN}, \mathrm{C}_{2}$ (29, 30 ), and $\mathrm{C}_{3}$ (31).

In fact, the new bands of CP were noticed because of the presence of the 2-2 band near the $\mathrm{C}_{3}$ triplet system (31). The emission from the discharge was focused on the entrance aperture of the McMath Fourier transform spectrometer of the National Solar Observatory at Kitt Peak. InSb detectors and silicon filters limited the band pass to the $1800-9000 \mathrm{~cm}^{-1}$ spectral region. An unapodized resolution of $0.02 \mathrm{~cm}^{-1}$ was used in these experiments. A total of 10 and 9 scans were co-added, respectively, in 70 and 65 min of integration. The spectra were calibrated using the measurements of the vibration-rotation lines of CO (32) impurity present in the spectra. The absolute accuracy of the calibration is estimated to be better than $\pm 0.001 \mathrm{~cm}^{-1}$.

## RESULTS AND DISCUSSION

The spectral line positions were extracted from the spectra using the data reduction program PC-DECOMP developed at Kitt Peak by J. Brault. The peak positions were found by fitting a Voigt lineshape function to each feature using a nonlinear leastsquares procedure. Since the spectra are very congested, we proceeded by initially predicting the line positions and then picking out and assigning just a few lines. The preliminary fit of these lines provided an accurate prediction of the remaining lines. The search for new bands involving the higher vibrational levels in both the states was guided by a preliminary Franck-Condon calculation.

The seven new bands identified and analyzed in the present study are 2-2,3-3,2-$0,3-1,1-3,4-3,2-4$. The structure of $4-3$ and $2-4$ bands is very weak so the ${ }^{2} \Pi_{1 / 2}-$

| $7-6$ | $6.5-5.5$ | $11.13122800(-79)$ |

${ }^{2} \Sigma^{+}$subbands could not be identified with certainty. The assignment of the new bands was straightforward using combination differences and estimates of the rotational constants for the higher vibrational levels based on the data provided in our previous study (5). The observed line positions and their rotational assignments are provided in Table I.

Initially, band-by-band fits of the line positions listed in Table I were made utilizing the effective Hamiltonian of Brown et al. (33). Matrix elements for this Hamiltonian are listed by Amiot et al. (34) for ${ }^{2} \Pi$ states and Douay et al. (35) for ${ }^{2} \Sigma$ states. In the final fit the observed transition wavenumbers of all the bands, together with the hy-perfine-free pure rotational transition wavenumbers (Table II) were fitted to determine the molecular constants provided in Tables III and IV. The pure rotational transition frequencies provided by Saito et al. (6) were corrected for the effects of hyperfine structure so that they could be introduced directly into our fits. For the 4-3 band the constants $A_{4}, A_{D 4}$, and $q_{4}$ were fixed to extrapolated values, since the ${ }^{2} \Pi_{1 / 2}{ }^{2} \Sigma^{+}$subband involving the $v^{\prime}=4$ level was not measured.

The constants of Tables III and IV were utilized to determine the equilibrium constants in both electronic states using the expressions

$$
\begin{aligned}
G(v) & =\omega_{\mathrm{e}}\left(v+\frac{1}{2}\right)-\omega_{\mathrm{e}} x_{\mathrm{e}}\left(v+\frac{1}{2}\right)^{2}+\omega_{\mathrm{e}} y_{\mathrm{e}}\left(v+\frac{1}{2}\right)^{3} \\
B_{v} & =B_{\mathrm{e}}-\alpha_{\mathrm{e}}\left(v+\frac{1}{2}\right)+\gamma_{\mathrm{e}}\left(v+\frac{1}{2}\right)^{2} .
\end{aligned}
$$

${ }^{a}$ Calculated relative to the minimum of the $X^{2} \Sigma^{+}$potential curve of the value of $\mathrm{cm}^{-1}$.

TABLE VII
Turning Points of the RKR Potential Energy Curve of the $X^{2} \Sigma^{+}$State of CP

| v | $\mathrm{E}(\mathrm{v})\left(\mathrm{cm}^{-1}\right)$ | $r_{\min }(\AA)$ | $r_{\max }(\AA)$ |
| :---: | :---: | :---: | :---: |
| 0.0 | 618.2003 | 1.5087 | 1.6211 |
| 0.5 | 1232.9734 | 1.4882 | 1.6476 |
| 1.0 | 1844.3276 | 1.4731 | 1.6687 |
| 1.5 | 2452.2618 | 1.4607 | 1.6871 |
| 2.0 | 3056.7749 | 1.4501 | 1.7038 |
| 2.5 | 3657.8661 | 1.4407 | 1.7193 |
| 3.0 | 4255.5341 | 1.4322 | 1.7339 |
| 3.5 | 4849.7781 | 1.4245 | 1.7477 |
| 4.0 | 5440.5969 | 1.4174 | 1.7610 |
| 5.0 | 6611.9549 | 1.4046 | 1.7863 |

The final equilibrium constants thus obtained are provided in Table V. These constants were used as input to an RKR program to calculate the classical turning points of the $A^{2} \Pi_{i}$ and $X^{2} \Sigma^{+}$potential energy curves (Tables VI and VII). Figure 1 is a plot of the potential energy curves of the $A^{2} \Pi_{i}$ and $X^{2} \Sigma^{+}$states of CP.

The RKR potential curves were used to calculate the Franck-Condon factors for the $A^{2} \Pi_{i}-X^{2} \Sigma^{+}$system (Table VIII). The observed relative intensity of various bands follows the predictions based on the Franck-Condon factors. The values of $B_{\mathrm{e}}^{\prime}$ and $B_{\mathrm{e}}^{\prime \prime}$ result in $r_{\mathrm{e}}$ values of $1.5619780(2)$ and 1.654421 (7) $\AA$ for $X^{2} \Sigma^{+}$and $A^{2} \Pi_{i}$ states, respectively.

The inclusion of the hyperfine-free microwave transition frequencies in our fits results in a very precise determination of the rotational constants in the ground vibrational state. The pure rotational transitions also help break correlations between constants of the $A^{2} \Pi$ and $X^{2} \Sigma^{+}$states. The constants provided in Tables II and III are in good agreement with the constants obtained in our previous study, except for $v^{\prime}=3$, because only the ${ }^{2} \Pi_{3 / 2}{ }^{2} \Sigma^{+}$subband of the 3-1 band was included in the previous analysis.

TABLE VIII
Franck-Condon Factors for the $\mathrm{A}^{2} \Pi_{i}-\mathrm{X}^{2} \Sigma^{+}$System of CP

| $v^{\prime \prime}$ <br> $\mathbf{v}^{\prime}$ | 0 | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0.2835 E 0 | 0.3907 E 0 | 0.2310 E 0 | $0.7680 \mathrm{E}-1$ | $0.1581 \mathrm{E}-1$ |
| 1 | 0.3240 E 0 | $0.1884 \mathrm{E}-1$ | 0.1352 E 0 | 0.2845 E 0 | 0.1743 E 0 |
| 2 | 0.2134 E 0 | $0.6721 \mathrm{E}-1$ | 0.1478 E 0 | $0.4140 \mathrm{E}-2$ | 0.1988 E 0 |
| 3 | 0.1070 E 0 | 0.1700 E 0 | $0.2411 \mathrm{E}-2$ | 0.1489 E 0 | $0.2849 \mathrm{E}-1$ |
| 4 | $0.4548 \mathrm{E}-1$ | 0.1601 E 0 | $0.5411 \mathrm{E}-1$ | $0.6174 \mathrm{E}-1$ | $0.6946 \mathrm{E}-1$ |

Fig. 1. Potential energy curves for the $A^{2} \Pi_{i}$ and $X^{2} \Sigma^{+}$electronic states of CP.

## ACKNOWLEDGMENTS

We thank R. Hubbard, J. Wagner, and G. Ladd for assistance in acquiring the CP spectra. The National Solar Observatory is operated by the Association of Universities for Research in Astronomy, Inc., under contract with the National Science Foundation. Acknowledgment is made to the donors of the Petroleum Research Fund, administered by the American Chemical Society for partial support of this work. Some support was also provided by the Natural Sciences and Engineering Research Council of Canada and the NASA Origins of the Solar System Program.
